

Cyber security – effective protection against cyber attacks.

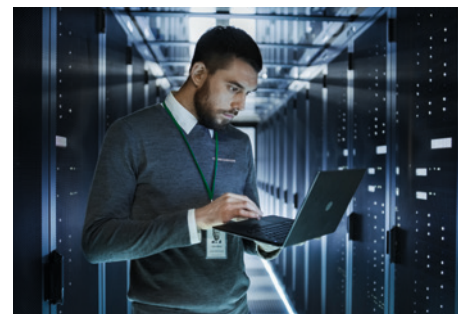

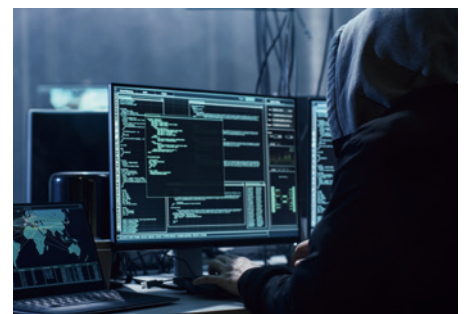

Alarm and security systems, like any networked infrastructure, are exposed to virtual threats from cyber criminals deploying highly professional methods. We keep you safe with our cyber security concept and bespoke solutions.

Professional security in the physical and virtual world

The struggle for the upper hand in terms of security is being fought intensively in the digital age: On one side are criminals with a variety of motives whose abilities should not be underestimated: their attacks using malware, phishing, ransomware or social engineering are becoming increasingly sophisticated. On the other side are technology providers, who offer their customers security solutions for warding off these dangers. Securiton customers can count on our alarm and security systems to provide them with effective protection, in the physical as well as the virtual world.

Security by design from start to finish

The “Bronze” cyber security package is our basic protection solution; it is included as standard in all Securiton alarm and security systems after commissioning. The “Silver” and “Gold” packages (for enhanced and bespoke security needs respectively) build on the basic package with additional services. Choose the package that best suits your security needs. We look forward to taking you through your options.

“Bronze” package

The basic security level – included in all our alarm and security systems.

“Silver” package

The advanced security level – for enhanced security needs.

“Gold” package

The premium security level – for bespoke security needs.

How to neutralise cyber risks:

- Intelligent security technology and cyber security from a single source
- Comprehensive approach over the entire life cycle of alarm and security systems
- Mature concept based on standards and best practices
- Products and services can be adapted to suit varied requirements
- Expert advice and support
